SUMMARY

Backend developer skilled in Java, Spring Boot, distributed systems, REST APIs, concurrency, and scalable backend architecture with hands-on experience in Saga patterns, idempotency, and asynchronous processing.

EDUCATION

Master of Computer Applications (MCA)

Jain University

Expected June 2026

Bachelor of Computer Applications (BCA)

Girijananda Chowdhury University

2020 – 2023

SKILLS

Languages: Java, SQL **Backend:** Spring Boot, Spring WebFlux, REST APIs **Databases:** MySQL, MongoDB, Elasticsearch

Messaging & Concepts: Apache Kafka, Saga Pattern, Idempotency, Concurrency, Async Processing **Tools/Cloud:** Docker, Git, Postman, GitHub Actions, AWS EC2, AWS S3

PROJECTS

Nivora Pay — Distributed Wallet System

Spring Boot, MySQL, ShardingSphere

[GitHub](#)

- Prevented duplicate wallet transactions by implementing idempotent transfer processing with exactly-once execution guarantees
- Solved distributed transaction inconsistency using Saga orchestration across debit, credit, and status operations
- Eliminated race conditions in concurrent balance updates through database-level locking mechanisms
- Improved transaction scalability and reduced API latency using asynchronous processing and database sharding

Nivora Ask — Reactive Q&A Platform

Spring Boot, WebFlux, MongoDB, Kafka, Elasticsearch

[GitHub](#)

- Solved scalability bottlenecks in synchronous APIs by building a reactive WebFlux backend for non-blocking request handling
- Reduced slow search response times by integrating Elasticsearch for optimized full-text querying
- Eliminated tight service coupling using Kafka-driven event communication for real-time notifications and feed updates
- Improved backend maintainability through layered architecture, DTO validation, and centralized exception handling

EXPERIENCE

Backend Developer Intern

Aug 2025 – Dec 2025

Invicto Labs, Bangalore

- Developed backend services using Node.js, Express.js, and MySQL for core platform features
- Designed and optimized REST APIs for efficient communication across internal services
- Refactored monolithic modules into modular architecture for better maintainability
- Automated browser-based workflows using Puppeteer, reducing manual operational effort
